

hybridized to primers in a manner to allow primer extension in the presence of nucleotides and a nucleic acid polymerase;

- b) providing at a second location, which is different from the first location, a plurality of single stranded nucleic acid molecules that have the same sequence[s] as one another, but that have different sequence[s] from the sequence[s] of the single stranded nucleic acid molecules at the first location, and that are also [hybridised] hybridized to primers in a manner to allow primer extension in the presence of nucleotides and a nucleic acid polymerase;
- c) providing each location with a nucleic acid polymerase and a given labelled nucleotide under conditions that allow extension of the primers if a complementary base or if a plurality of such bases is present at the appropriate position in the single stranded nucleic acid molecules;
- d) detecting whether or not said labelled nucleotide has been used for primer extension at each location by determining whether or not the label present on said nucleotide has been incorporated into extended primers and if said labelled nucleotide has been used in primer extension this step includes a further step of detecting how many of said nucleotides have been used per extended primer;
- e) repeating steps c) and d) one or more times so that extended primers comprising a plurality of labels are provided;
- whereby the sequence of the nucleic acid molecules is obtained by reference to the number and type of nucleotides used in primer extension at each location.

2. (Amended) A method according to claim 1, [wherein] further comprising converting all or part of the sequence [that is] obtained in step e) [is converted to provide a] to its complementary sequence [thereto].

4. (Amended) A method according to claim 1, wherein after step c) excess nucleotides that have not been used in primer extension are removed [(e.g. by washing)].

1 5. (Previously Amended) A method according to claim 1, wherein step d) uses absorption or
2 emission spectrometry.

1 6. (Twice Amended) A method according to claim 1, wherein said single stranded
2 nucleic acid molecules, said primers or both of the aforesaid are [immobilised] immobilized.

B3
1 7. (Twice Amended) A method according to claim 1 [that is used to fully or
partially sequence] wherein 10 or more nucleic acid molecules having different sequences are
2 fully or partially sequenced at 10 or more different locations simultaneously.

SUB
E4
1 8. (Twice Amended) A method according to claim 1 [that is used to fully or
2 partially sequence] wherein 100 or more nucleic acid molecules having different sequences are
3 fully or partially sequenced at 10 or more different locations simultaneously.

1 9. (Twice Amended) A method according to claim 1 [that is used to fully or
2 partially sequence] wherein 1000 or more nucleic acid molecules having different sequences
3 are fully or partially sequenced at 10 or more different locations simultaneously.

1 10. (Previously Amended) A method according to claim 1, wherein each of four different
2 nucleotides is used in primer extension.

1 11. (As Filed) A method according to claim 10, wherein said four different nucleotides are used in
2 a predetermined order in repeated cycles.

1 12. (Previously Amended) A method according to claim 10, wherein the nucleotides are dATP,
2 dTTP, dGTP and dCTP in labelled form.

1 13. (As Filed) A method according to claim 10, wherein the nucleotides are ATP, UTP, GTP and
2 CTP in labelled form.

1 14. (Previously Amended) A method according to claim 1, wherein the detection step is carried
2 out without moving the nucleic acid molecules from the different locations.

1 15. (Twice Amended) A method as described in claim 1 with the exception that
2 double stranded nucleic acid molecules having nicks therein are provided at the first and/or
3 second locations instead of providing single stranded molecules [hybridised] hybridized to
4 primers.

1 16. (Previously Amended) A method as described in claim 1 with the exception that only one
2 nucleic acid molecule is provided at the first and/or second locations.

1 17. (Amended) A method for sequencing nucleic acid molecules, comprising the
2 steps of:
3 a) providing at a first location a plurality of single stranded nucleic acid molecules
4 that have the same sequences as one another and that are [hybridised]
5 hybridized to primers in a manner to allow primer extension in the presence of
6 nucleotides and a nucleic acid polymerase;
7 b) providing at a second location, which is different from the first location, a
8 plurality of single stranded nucleic acid molecules that have the same sequences
9 as one another, but that have different sequences from the sequences of the
10 single stranded nucleic acid molecules at the first location, and that are also
11 [hybridised] hybridized to primers in a manner to allow primer extension in the
12 presence of nucleotides and a nucleic acid polymerase;
13 c) providing each location with a nucleic acid polymerase and a given nucleotide
14 in labelled and unlabelled form under conditions that allow extension of the
15 primers if a complementary base or if a plurality of such bases is present at the
16 appropriate position in the single stranded nucleic acid molecules;
17 d) detecting whether or not said labelled nucleotide has been used for primer
18 extension at each location by determining whether or not the label present on
19 said nucleotide has been incorporated into extended primers, and if said labelled
20 nucleotide has been used in primer extension, this step includes a further step of
21 detecting how many of said nucleotides have been used per extended primer;

- 22 e) repeating steps c) and d) one or more times;
23 whereby the sequence of the nucleic acid molecules is obtained by reference to
24 the number and type of nucleotides used in primer extension at each location.

- 1 21. (Amended) A method of sequencing a target nucleic acid comprising:
2 (a) hybridizing the target nucleic acid to a primer whereby the target nucleic acid
3 can serve as a template for extension of the 3' end of the primer;
4 (b) incubating the hybridized target nucleic acid/primer with a polymerase and a
5 type of nucleotide bearing a label under conditions supporting template-directed
6 extension of the primer if the nucleotide type can be incorporated as the
7 complement of a corresponding nucleotide of the target;
8 (c) measuring first label incorporated into the primer to determine whether, and if
9 so, by how many base increments, the primer has been extended by
10 **[incorporated] incorporation** of the nucleotide type;
11 (d) incubating the hybridized primer/target nucleic acid with a different type of
12 nucleotide bearing a label under conditions supporting template-directed
13 extension of the primer if the different nucleotide type can be incorporated so as
14 to be complementary to a corresponding nucleotide in the target;
15 (e) measuring incremental label incorporated into the primer due to the previous
16 incubating step to determine whether, and if so, by how many base increments,
17 the primer has been extended by incorporation of the different nucleotide type;
18 and
19 (f) repeating steps (b) - (e) until a desired portion of the target sequence can be
20 determined from the incremental base additions to the primer.

- 1 23. (Previously Amended) A method according to claim 21 with the exception that instead of
2 hybridizing a target nucleic acid molecule to a primer and extending the primer with labelled nucleotides, a nick is
3 introduced into a double-stranded nucleic acid molecule and the nick is extended using nick translation and
4 labelled nucleotides.
